Equivalent Areas

As allowed by DEQ Water Quality Division Policy # 13.41.2, dated November 21, 1994, gravelless leachfield chambers get double infiltrative surface area credit for the bottom area of the chamber. This is allowed because research indicates that chambers provide an optimum infiltrative surface by eliminating the 50% stone masking associated with conventional systems utilizing stone in the leach field. Since these types of chambers are manufactured units with fixed dimensions, an equivalent infiltrative surface area can be pre-calculated for any make and model of chamber. In a trench configuration, the equivalent area is equal to 2 * (width + effective side wall height) * unit length. In a bed configuration the side wall is not counted, so the equivalent area is equal to 2 * width * unit length. The following table shows the equivalent areas of several types and models of these units for both bed and trench applications:
